

*****BEGIN INSTRUCTIONS*****

Attached is the XML Schema (MOInspection-02-22-2011.xsd) and the XML Schema Validation Tool (SchemaValidator.txt).

The <SchemaValidator.exe> file is an application that can be used to validate or test an XML file before submittal. Note that the file extension is sent as <.ex_> in order to pass through firewall filters. That needs to be changed to <.exe> before running the program.

Instructions for use:

1. Save <SchemaValidator.txt> and <MOInspection-02-22-2011.xsd> to the hard drive and in the same folder. Change the name extension from <.exe> to <.exe>

2. From Windows "Start" menu select "run". Type "cmd". Select "OK"

3. At the "command prompt" type
<cd> <space> <the full path and name of the folder containing the validator tool <SchemaValidator.exe>>

for example:

C:\> cd C:\MyDocuments\Boilers\Our_Data_To_Upload

4. Press Enter, to get

C:\MyDocuments\Boilers\Our_Data_To_Upload>

5. At this command prompt type in this order

<name of the Schema Validator>

<space>

<name of the sample XML file to validate>

<space>

<name of the Schema XSD file to validate the file against>

(Note that all of the files need to be in the same folder.)

for example:

C:\MyDocuments\Boilers\Our_Data_To_Upload>SchemaValidator.exe SampleFile.xml MOInspection-02-22-2011.xsd

6. Press Enter to get results. The results will be either indicating success, or a detailed description of the failure points.

*****END INSTRUCTIONS*****
